Per OSHA's standards, the proper sequence for developing safety curriculum is to:

1. Develop a written plan for how to engineer out and/or work around the workplace hazard, identified during a safety audit.
  2. Identify workers exposed to these hazards while performing their job duties.
  3. Create a Job Safety Analysis for each job description.
  4. Create training that demonstrates the hazard in the workplace and how to work safely around the hazard.
- The chart displays the course schedule for the job titles within each department.

With **The Total Program**, relationships between your written plans, training and job titles are clearly defined in a centralized location.
